

Grammars and Parsing

CMPUT 275 - Winter 2018

University of Alberta

Parsing

- Parsing is the process of converting a source string into a structured form, known as an Abstract Syntax Tree (AST)
- It consists of two phases:
 - lexical analysis: converts strings of characters into lists of tokens
(alpha * beta)  ["(", "alpha", "*", "beta", ")"]
 [LPAR, NAME, BINOP, NAME, RPAR]

Tokens are divided into classes, such as BINOP (to stand for any binary operator), or NAME (to stand for an variable name)

- parsing algorithm: takes a grammar (syntax of a language) and a stream of lexical tokens, and produces the AST.

Tokenizing an input string

Tokenizing an input string

- input string:

Tokenizing an input string

- input string:

`x = 3 + 42 * (s - t)`

Tokenizing an input string

- input string:

`x = 3 + 42 * (s - t)`

- individual tokens:

Tokenizing an input string

- input string:

`x = 3 + 42 * (s - t)`

- individual tokens:

`'x', '=', '3', '+', '42', '*', '(', 's', '-', 't', ')'`

Tokenizing an input string

- input string:

`x = 3 + 42 * (s - t)`

- individual tokens:

`'x', '=', '3', '+', '42', '*', '(', 's', '-', 't', ')'`

- pairs of token types and values

Tokenizing an input string

- input string:

`x = 3 + 42 * (s - t)`

- individual tokens:

`'x', '=', '3', '+', '42', '*', '(', 's', '-', 't', ')'`

- pairs of token types and values

`('ID', 'x'), ('EQUALS', '='), ('NUMBER', '3'), ('PLUS', '+'),
('NUMBER', '42'), ('TIMES', '*'), ('LPAREN', '('), ('ID', 's'),
('MINUS', '-'), ('ID', 't'), ('RPAREN', ')')`

Context Free Grammars

- A grammar is collection of recursive rewriting rules (or productions) that say how to combine tokens into grammatical components. The rules are of the form:
lhs := rhs_0 rhs_1 ... rhs_n
- Productions use two kinds of symbols
 - terminals - which correspond to tokens. Terminals are atomic, in the sense that they are never produced by the grammar, and never appear on a lhs.
 - nonterminals or variables - which correspond to language fragments, or phrases. Variables describe kinds of fragments in the language, and the grammar rules describe how variables are constructed by combining other variables and terminals.
- Both of these are sets. Terminals are sets of tokens. Variables are sets of phrases.
- A grammar has a start symbol, usually a nonterminal.
- A legal string as defined by the grammar is anything that can be generated from the start symbol using productions.

Example

Here is a simple grammar:

$A ::= A A$

$A ::= a$

$A ::= b$

Example

Here is a simple grammar:

$A ::= A A$

$A ::= a$

$A ::= b$

$A = AA$

$= aA$

$= ab$

$A = AA$

$= Ab$

$= ab$

Example: Postal code

Here is a simple grammar for postal codes:

PCODE := L D L D L D

L := a | b | ... | z

D := 0 | 1 | ... | 9

Example: Postal code

Here is a simple grammar for postal codes:

PCODE := L D L D L D

L := a | b | ... | z

D := 0 | 1 | ... | 9

PCODE := S S S

S := L D

L := a | b | ... | z

D := 0 | 1 | ... | 9

Example: Boolean expressions

Here is a simple grammar for boolean expressions:

```
expr := constant
expr := '(' expr bin_op expr ')'
expr := unary_op expr
constant := 'True' | 'False'
bin_op := 'and' | 'or' | 'xor'
unary_op := 'not'
```

Example

Here is a simple grammar for the English language:

$S \rightarrow NP \ VP$

$VP \rightarrow V \ NP$

$NP \rightarrow N \mid D \ N$

$N \rightarrow \text{boy} \mid \text{girl} \mid \text{John} \mid \text{flowers} \mid \dots$

$D \rightarrow \text{a} \mid \text{the}$

$V \rightarrow \text{sees} \mid \text{likes} \mid \dots$

Example

Here is a simple grammar for the English language:

$S \rightarrow NP \ VP$

$VP \rightarrow V \ NP$

$NP \rightarrow N \mid D \ N \mid ADJ \ N \mid D \ ADJ \ N$

$N \rightarrow \text{boy} \mid \text{girl} \mid \text{John} \mid \text{flowers} \mid \dots$

$ADJ \rightarrow \text{big} \mid \text{small} \mid \dots$

$D \rightarrow \text{a} \mid \text{the}$

$V \rightarrow \text{sees} \mid \text{likes} \mid \dots$

Example

Here is a simple grammar for the English language:

$S \rightarrow NP \ VP$

$VP \rightarrow V \ NP$

$NP \rightarrow N \mid D \ N \mid ADJ \ N \mid D \ ADJ \ N$

$N \rightarrow \text{boy} \mid \text{girl} \mid \text{John} \mid \text{flowers} \mid \dots$

$ADJ \rightarrow \text{big} \mid \text{small} \mid \dots$

$D \rightarrow \text{a} \mid \text{the}$

$V \rightarrow \text{sees} \mid \text{likes} \mid \dots$

Today is a cold day

**Is it a valid string
(grammatically correct)?**

Example

Here is a simple grammar for the English language:

$S \rightarrow NP \ VP$

$VP \rightarrow V \ NP$

$NP \rightarrow N \mid D \ N \mid ADJ \ N \mid D \ ADJ \ N$

$N \rightarrow \text{boy} \mid \text{girl} \mid \text{John} \mid \text{flowers} \mid \dots$

$ADJ \rightarrow \text{big} \mid \text{small} \mid \dots$

$D \rightarrow \text{a} \mid \text{the}$

$V \rightarrow \text{sees} \mid \text{likes} \mid \dots$

Today is a cold day

**Is it a valid string
(grammatically correct)?**

Example

Here is a simple grammar for the English language:

$S \rightarrow NP \ VP$

$VP \rightarrow V \ NP$

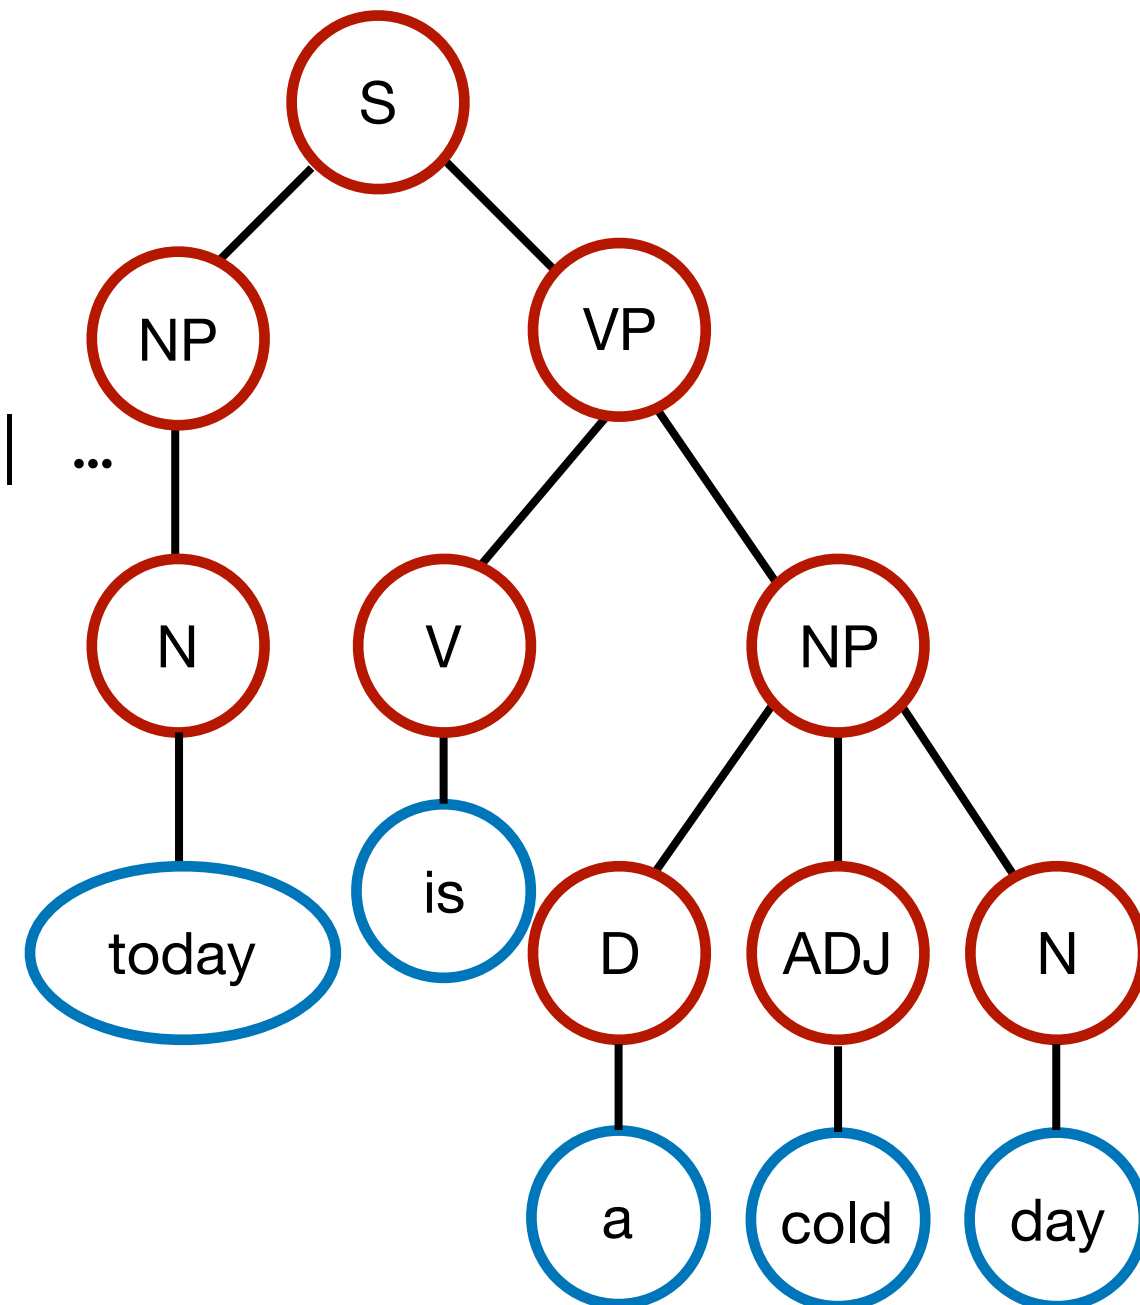

$NP \rightarrow N \mid D \ N \mid ADJ \ N \mid D \ ADJ \ N$

$N \rightarrow \text{boy} \mid \text{girl} \mid \text{John} \mid \text{flowers} \mid \dots$

$ADJ \rightarrow \text{big} \mid \text{small} \mid \dots$

$D \rightarrow \text{a} \mid \text{the}$

$V \rightarrow \text{sees} \mid \text{likes} \mid \dots$

Today is a cold sunny day
How about this one?

Example

Here is a simple grammar for the English language:

$S \rightarrow NP \ VP$

$VP \rightarrow V \ NP$

$NP \rightarrow NP1 \mid D \ NP1$

$NP1 \rightarrow N \mid \mid ADJ \ NP1$

$N \rightarrow \text{boy} \mid \text{girl} \mid \text{John} \mid \text{flowers} \mid \dots$

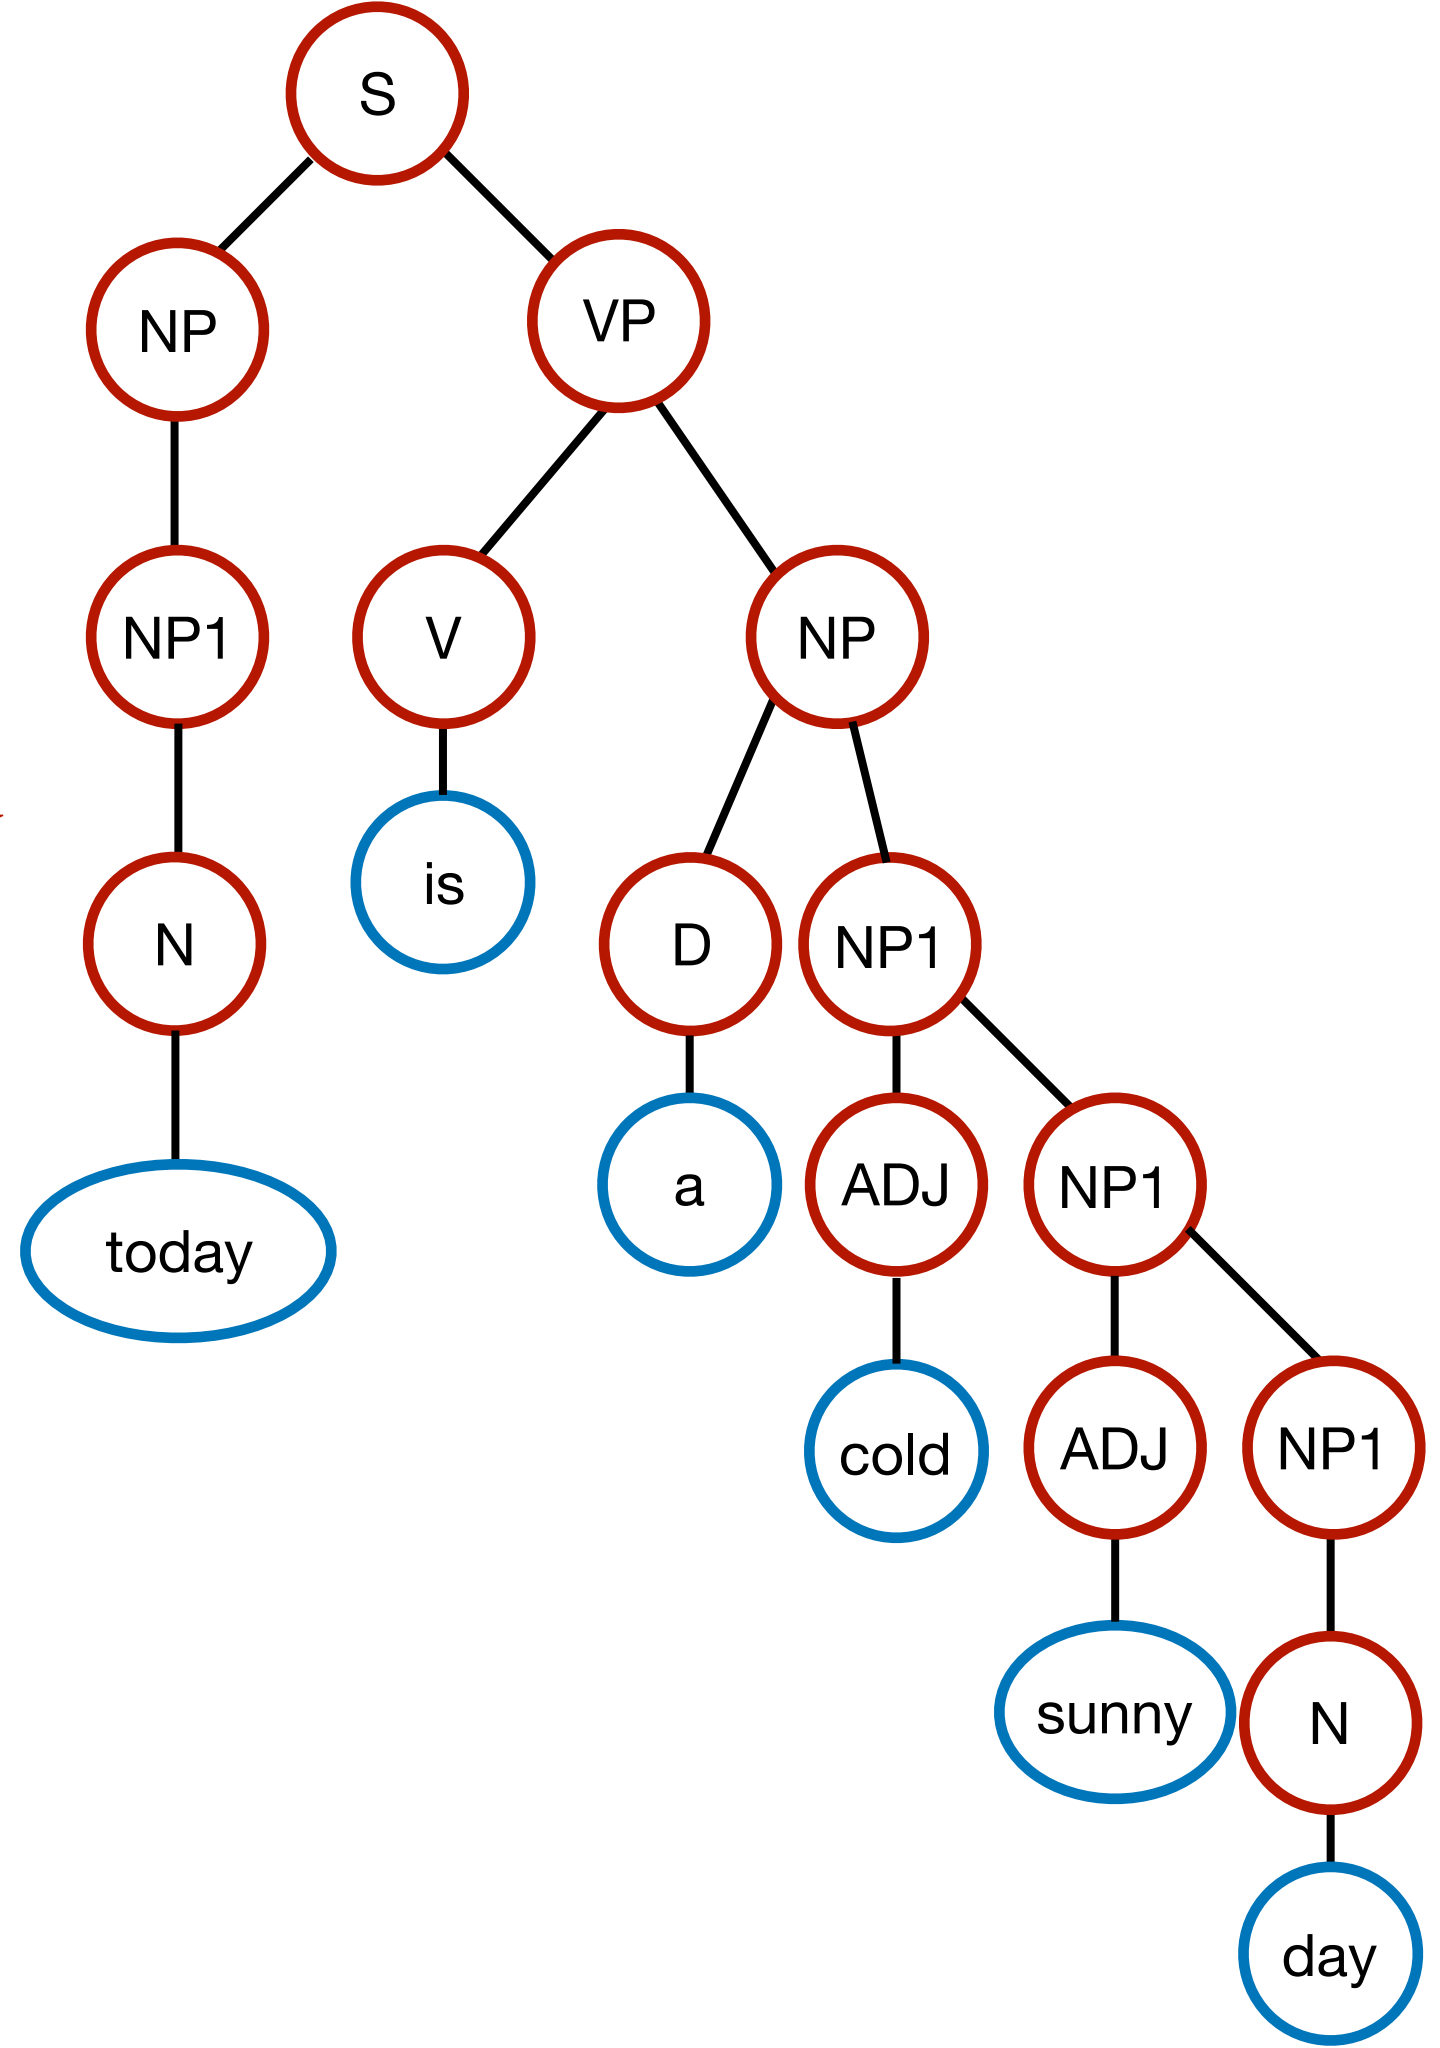

$V \rightarrow \text{sees} \mid \text{likes} \mid \dots$

$ADJ \rightarrow \text{big} \mid \text{small} \mid \dots$

$D \rightarrow \text{a} \mid \text{the}$

Example

Today is a cold sunny day
How about this one?

Example

Tokens

```
literals = ['=', '+', '-', '*', '/', ]  
NAME = r'[a-zA-Z_][a-zA-Z0-9_]*'  
COMMA = r','  
LPAREN = r'\('  
RPAREN = r'\)'  
NUMBER = r'\d+'
```

Grammar

```
S' -> statement  
statement -> expression  
statement -> <empty>  
expression -> NAME = expression  
expression -> expression + expression  
expression -> expression - expression  
expression -> expression * expression  
expression -> expression / expression  
expression -> - expression  
expression -> NAME LPAREN RPAREN  
expression -> NAME LPAREN expr_list RPAREN  
expression -> LPAREN expression RPAREN  
expr_list -> expression  
expr_list -> expr_list COMMA expression  
expression -> NUMBER  
expression -> NAME
```

Parser Generator

- Defining the grammar for a complex language is a difficult and error-prone process. Hand crafting a parser for a grammar is even worse.
- Thus tools for converting grammars into parsers have been developed, commonly called compiler-compilers (then compile a description into a compiler). *yacc* stands for yet-another-compiler-compiler. The actual mechanics of parsing is quite simple to describe in terms of the operation of a type of machine called a push-down automata (or stack machine). It's getting the specific rules right that is tricky.
